\*ONLY ESB Brand Lamps have internal reflectors, increasing output up to 50%.

\*\*Pink areas of the lamps have higher UVB output for more melanin production.

\*\*Swirl areas of the lamps have more surface area, adding ~15% more power.\*

All lamp orders are 100% covered against any shipping damage.

Order 1-24 lamps, pay only \$40 Shipping.

Order 25-48 lamps, pay only \$80 Shipping.

Please inquire about discounts on larger lamp orders.

Most lamp orders are filled within 2 weeks via. FedEx.

Lamps only ship to the contiguous United States.

Sorry, we do not sell phototherapy lamps such as Red, Blue light or infrared.

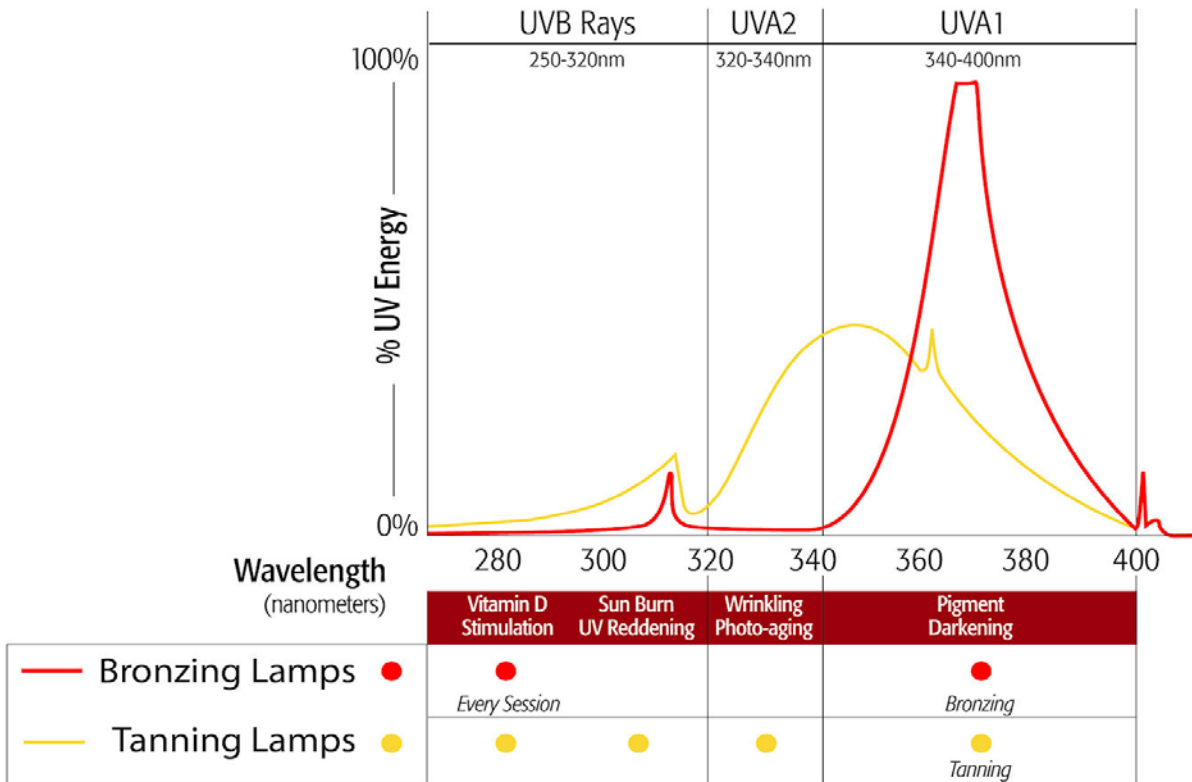

# ESB Service Tanning / Bronzing Lamps

## What is the difference between Tanning and Bronzing Lamps?

Bronzing lamps have a lot more UVA and a less UVB than most tanning lamps. UVB produces melanin (necessary to start the tanning process) and Vitamin D within the skin, but overexposure to UVB can also redden some people's skin. UVA Browns the melanin (which starts out more pink-ish) after it's produced, so more UVA in bronzing lamps is where all the "Bronzing Power" comes from. Therefore, tanning lamps may be better for beginners or tanners with fairer skin, while bronzing lamps may be better for more advanced tanners with darker skin. Tanning Lamps are rated at 1,000 hours of life, while Bronzing Lamps are 1,200.

This chart depicts the difference in the output of tanning and bronzing lamps. The bronzing lamp curve is red, while the tanning lamp curve is yellow. From left to right is the spectrum of Ultraviolet light measured in Nanometers. Going up and down is the amount of power given at the respective wavelengths.

## Tanning Lamps Vs. Bronzing Lamps
